Notes:

- Write your name and ID number in the solution you submit.
- No books, cell phones or other notes are permitted. Only one letter size cheat sheet (back and front) and a calculator are allowed.
- Problems are not sorted in terms of difficulty. Please avoid guess work and long and irrelevant answers.
- Show all your work and your final answer. Simplify your answer as much as you can.
- Open your exam only when you are instructed to do so.
- The exam has 5 questions, 11 pages, and 20 points extra credit.
- In online exams, legible copies SCANNED via phone applications must be submitted, not pictures of answer sheets.
- Make sure you submit ALL pages of your answers. Answers submitted after the exam is adjourned WILL NOT BE ACCEPTED.

Problem	Score	Earned
1	25	
2	25	
3	25	
4	25	
5	20	
Total	120	

1. Based on 64 students' scores on the first examination in a course on business statistics, the following model was estimated by least squares:

$$\hat{y} = \beta_0 + \hat{\beta}_1 x_1 + \hat{\beta}_2 x_2 + \hat{\beta}_3 x_3$$
$$\hat{y} = 2.178 + 0.469x_1 + 3.369x_2 + 3.054x_3$$

The standard errors are:

$$\text{SE}(\hat{\beta}_1) = 0.090$$
$$\text{SE}(\hat{\beta}_2) = 0.456$$
$$\text{SE}(\hat{\beta}_3) = 1.457$$

Also, $R^2 = 0.686$.

- $\hat{y}$: student's actual score on the examination
- x_1: student's expected score on the examination
- x_2: hours per week spent working on the course
- x_3: student's grade point average

(a) Interpret the estimated coefficient $\hat{\beta}_1$.

(b) Find and interpret a 95% confidence interval for β_2.

(c) Test the null hypothesis that β_3 is 0 at $\alpha = 0.05$, and interpret your result.

(d) Test the null hypothesis that $\beta_1 = \beta_2 = \beta_3$ at $\alpha = 0.01$ and interpret your result.

(e) Predict the score of a student who expects a score of 80, works 8 hours per week on the course, and has a grade point average of 3.0.

2. Consider the following multiclass dataset:

Index	X_1	X_2	Y
1	0	-1	+
2	0	0	-
3	-2	3	-
4	12	1	*
5	-5	7	-
6	1	-9	+
7	19	-10	+
8	0	15	*
9	12	-4	+

For this dataset, determine the leave-one-out cross validation estimate of the misclassification error of a simple classifier that *classifies to the prior*, i.e always classifies to the most common class in its training set. If you ever encounter a tie, break it in favor of * and then +.

3. Assume that in a binary classification problem with one feature X, the distribution of X in class $k = 1$ is

$$f_1(x) = \frac{1}{2} \exp\left(-\frac{x}{2}\right), x \geq 0$$

and the distribution of X in class $k = 2$ is

$$f_2(x) = \frac{1}{4} x \exp\left(-\frac{x}{2}\right), x \geq 0$$

   (a) Derive the discriminant functions $\delta_1(x)$ and $\delta_2(x)$ assuming the prior class probabilities satisfy $\pi_1 = \pi_2$.

   (b) Find the decision boundary between the two classes and determine to what class $x = 3$ is classified.

4. Consider multinomial regression for multiclass classification with three features $\mathbf{X} = (X_1, X_2, X_3)$, formulated by

$$p_k(\mathbf{X}) = \frac{e^{\beta_{0k}+\beta_{1k}X_1+\beta_{2k}X_2+\beta_{3k}X_3}}{e^{\beta_{01}+\beta_{11}X_1+\beta_{21}X_2+\beta_{31}X_3} + e^{\beta_{02}+\beta_{12}X_1+\beta_{22}X_2+\beta_{32}X_3} + e^{\beta_{03}+\beta_{13}X_1+\beta_{23}X_2+\beta_{33}X_3}}, \quad k \in \{1, 2, 3\}$$

Assume that using a data set of 498 observations from three classes, we obtained the following results:

Coefficient	Value	Standard Error
β_{01}	1	
β_{11}	-2	s_1
β_{21}	-1	s_2
β_{31}	1.5	s_3
β_{02}	0	
β_{12}	0	
β_{22}	-2.5	s_4
β_{32}	0	
β_{03}	0	
β_{13}	0	
β_{23}	0	
β_{33}	2	s_5

(a) Determine the minimum value for standard errors s_1, s_2, s_3, s_4, s_5 so that their corresponding coefficients are statistically significant at level $\alpha = 0.05$. Assume all other coefficients are statistically significant.

(b) In what class will the classifier classify $\mathbf{X}^* = (0, 0, -1)$?

(c) Find the equation of the decision boundary between classes 1,2 and the decision boundary between classes 1,3 and the decision boundary between classes 2,3.

5. Assume that in a linear regression problem, we have four features X_1, X_2, X_3, X_4 and $X_3 = 4.45X_1 - 6.87$. Explain why each of the following terms are valid or invalid shrinkage penalties in general. For those that are valid shrinkage penalties, why they are appropriate or inappropriate for this particular problem with four features X_1, X_2, X_3, X_4 and $X_3 = 4.45X_1 - 6.87$:

   (a) β_2^2.

   (b) $\beta_1^5 + \beta_2^5 + \beta_3^5 + \beta_4^5$.

   (c) $|\beta_1| + \beta_2^2 + |\beta_3| + \beta_4^6$.

   (d) $\beta_1^2 + |\beta_2| + \beta_3^6 + |\beta_4|$.

   (e) $\sqrt{|\beta_1|} + \beta_3^2$

Cumulative Distribution Function, $F(z)$, of the Standard Normal Distribution Table

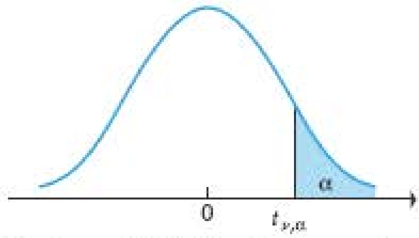
Upper Critical Values of Student's t Distribution with ν Degrees of Freedom



For selected probabilities, α, the table shows the values $t_{\nu,\alpha}$ such that $P(t_\nu > t_{\nu,\alpha}) = \alpha$, where t_ν is a Student's t random variable with ν degress of freedom. For example, the probability is .10 that a Student's t random variable with 10 degrees of freedom exceeds 1.372.
